CLIFF ASSEMBLY

10-SECOND CINEMATIC BUILD • AI VIDEO PROMPT

10 SEC	16:9	PHYSICAL ASSEMBLY	EXACT FINAL FRAME

PRODUCT OVERVIEW

A ready-to-use cinematic image-to-video prompt for physically assembling a luxury cliffside residence piece by piece, while locking the completed shot to the supplied reference image.

FULL PROMPT

CLIFF ASSEMBLY — 10-SECOND CINEMATIC BUILD

Use the uploaded reference image as the EXACT FINAL FRAME.

Create a hyper-realistic 10-second cinematic luxury architecture sequence, 16:9.

The entire construction sequence must lead precisely to the uploaded reference image. The final architecture, geometry, materials, landscape, lighting, colors, objects, camera angle, framing and composition MUST remain identical to the uploaded image.

DO NOT redesign, reinterpret, replace or modify anything visible in the reference image.

Begin before the final architecture is completed.

Show the same location and environment from the reference image while two enormous hands wearing fitted matte-black architectural gloves physically assemble the project piece by piece.

Everything must be physically carried, positioned, connected and secured.
NO magic.
NO morphing.
NO teleportation.
NO objects appearing from nowhere.

0.0–1.5s
Approach the construction location cinematically. A giant gloved hand carries the main structural platform into position and firmly presses it against the terrain or supporting structure. Tiny construction workers physically drill, bolt and anchor it. The hand releases only after the platform is completely secured.

1.5–3.2s
A second giant hand carefully carries the main architectural volume and lowers it onto the structural platform. Workers guide the placement while mechanical supports lock the structure into its exact position.

3.2–4.0s
Giant fingers carry the large glass facade panels, precisely align them with the architectural frame and physically slide them into position.

4.0–5.2s
The giant hands carry and install the pool structure shown in the reference image. Workers mechanically connect and seal it. Only after installation is complete do the hands release it. Clear water physically flows into the pool with realistic reflections, refraction and water movement.

5.2–6.2s
The hands physically place the exterior elements, landscaping, furniture and architectural details visible in the uploaded reference image into their exact final positions.

6.2–7.0s
Any vehicle visible in the reference image is physically lowered into its exact location. The tires make contact with the surface, suspension naturally compresses, and only then does the hand release it.

7.0–7.8s
Any rooftop, terrace or exterior feature visible in the reference is physically installed and completed. Every element must correspond to the uploaded image.

7.8–9.0s
Perform a fast but smooth cinematic FPV movement through and around the completed architecture, revealing the materials, glazing, interior spaces, terrace, pool and surrounding environment.

9.0–10.0s
The camera smoothly returns to the EXACT ORIGINAL CAMERA POSITION of the uploaded reference image.

The final frame MUST match the uploaded image EXACTLY.

STRICT FINAL-FRAME LOCK:
The uploaded image is the absolute visual target.
Final camera position = identical.
Camera angle = identical.
Lens perspective = identical.
Architecture = identical.
Building proportions = identical.
Materials = identical.
Windows and doors = identical.
Pool = identical.
Furniture and objects = identical.
Landscape = identical.
Background = identical.
Lighting = identical.
Colors = identical.
Composition = identical.

Do not add, remove, redesign or relocate anything in the final frame.

Realistic gravity, physical weight, contact pressure, structural movement, construction dust, reflections, glass physics and water physics.

Every component must be visibly carried → aligned → installed → secured → released.

The sequence may animate the construction process, but the FINAL FRAME MUST BE VISUALLY IDENTICAL TO THE UPLOADED REFERENCE IMAGE.

QUICK USE GUIDE

Upload the completed architectural reference image, then paste the full prompt into your image-to-video workflow.

1. Reference Image: Use the exact finished project image that must appear at the end.

2. Duration: Generate a 10-second sequence in 16:9.

3. Assembly: Components must be physically carried, aligned, installed, secured, and released.

4. Physics: Preserve believable weight, gravity, contact, glass behavior, reflections, and water movement.

5. Final Lock: The camera must return to the original reference position and the last frame must reproduce the uploaded image without redesign.

CRITICAL PROTECTION RULES

No magic, morphing, teleportation, unexplained object appearance, architectural redesign, relocated elements, changed materials, altered landscape, different camera perspective, or modified final composition.
